The two chromosomes in a homologous pair are
generally very similar to one another.
They're the same size and shape, and have the
same pattern of light and dark bands, as you
can see in the human karyotype (image of the
chromosomes) shown above. Bands appear when
the chromosomes are stained with a dye, and
the dark bands mark more compacted DNA
(usually, with fewer genes), while the light

The chromosomes are very long thin strands of DNA, that are coiled up like a ball of string as shown in Figure 1.3. The chromosomes containing the genes are located in the nucleus (or control centre) of our body cells (Figure 1.4).

Discovered in the mid 19th Century, chromosomes are bundles of tightly packed DNA located in the nucleus (in eukaryotic cells).In prokaryotes, however, the chromosome exists as a circular DNA (located in the cytoplasm in the nucleoid) that can also be found in the plasmids.In eukaryotic cells, also, chromosomes can be found outside the nucleus in such organelles as the

DNA Replication – Principles of Biology

Genes are packaged in bundles called chromosomes. Humans have 23 pairs of chromosomes, resulting in 46 individual chromosomes. Of those pairs, one pair, the x and y chromosome, determines whether you are male or female, plus some other body characteristics. Females have an XX pair of chromosomes while men have a pair of XY chromosomes.
