If the compression ratio of the internal combustion engine is much greater than 10:1, preignition or detonation may occur and cause overheating, loss of power, and damage to the engine. As the compression ratio increases, the pressure in the cylinder will also increase. Define brake specific fuel consumption. It is the number of pounds of fuel burned per hour for each bhp produced.

The fuel (coal, wood, oil) in a steam engine burns outside the engine to create steam, and the steam creates motion inside the engine. Internal combustion is a lot more efficient than external combustion, plus an internal combustion engine is a lot smaller. Let's look at the internal combustion process in more detail in the next section.
